What is Domain Isolated Webparts

- Web Parts that **securely communicate** with APIs secured with Azure AD without exposing the access token to other components on the page or even scripts in the tenant.

Domain isolated web parts – supporting also isolated permissions

Pros

- More Secure
- Can be beneficial for the enterprises who is having more than one vendor

Cons

- Renders within Iframe
- Even the Property Pane renders with Iframe
- Not sure, what difference this makes when comparing to Provider Hosted Application

Key Elements

- Disposal of Isolated WebPart.
- Deploying Isolated Webpart
 - SPFx Solution should contain only the Webparts. No other components.
 - Redeploy the solution and the new API permission must be approved by the tenant admin.
- Removing Solutions
 - The API Permissions needs to be removed manually.

A Big Thank You to all the Sponsors!
